

Rx Pain Medications

KNOW THE OPTIONS . GET THE FACTS

Dangerous Drug Interactions

Please consult your health care provider before using prescription pain medications with other substances.

Did you know...

According to the CDC, about one-half of deaths from prescription pain medications involve the use of at least one other drug.¹

Mixing opioids with other substances can cause dangerous side effects, including breathing trouble, coma, and even permanent brain damage or death.^{2,3}

If you are taking prescription pain medications, do NOT take the following without first talking to your health care provider:

- Alcohol (including beer, wine, and liquor)
- Antihistamines (including allergy medications such as Benadryl®)
- Cough medicine/cough syrup
- Barbiturates and benzodiazepines (often used as sleeping pills and sedatives, such as Ambien®, Xanax®, and Valium®)
- General anesthetics (often used for surgery)

To find more information on safer, more effective pain management in the CDC Guideline for Prescribing Opioids for Chronic Pain, visit http://www.cdc.gov/drugoverdose/prescribing/guideline.html.

IN CASE OF EMERGENCY

Call 9-1-1 or the National Poison Help number at 1-800-222-1222.
